WATERSHED PROJECT: NIGER DELTA

\$4,200,000 turnkey project, including:

- Construction work to prepare sites
- Equipment Supply
- Equipment Installation and commissioning
- Staff training courses

Eagle Scientific Ltd won a tender to supply weather monitoring and flood warning equipment to 37 sites in the Niger Delta. The project also included civil works on the sites to ensure they were suitable and secure for the equipment.

The equipment included automatic weather stations, as well as direct monitoring equipment for water levels and other environmental parameters.

Our engineers visited the sites and for installation and commissioning, accompanied by a local team from the client to ensure knowledge transfer and sustainability for the project. Our engineers also provided a formal training course on use of the equipment and its maintenance.

Despite the remoteness and difficulty of access to the sites, as well as an evolving security situation, Eagle Scientific completed its obligations on time and to a high standard.
